IN THE CLAIMS:

Please amend claims 3 and 15, as shown in the complete list of claims that is presented below.

Claims 1 and 2 (cancelled).

3. (currently amended) A dry etching method for a semiconductor device, comprising:

providing a polysilicon layer formed on a silicon substrate;

implanting a first region of the polysilicon layer with N type ions and a second region of the polysilicon layer with P type ions, a further region of the polysilicon layer being left as a non-doped region;

simultaneously gate-etching an N type polysilicon gate electrode from the first region, a P type polysilicon gate electrode from the second region, and a non-doped polysilicon dummy gate arrangement from the non-doped region of the polysilicon layer during a two-stage etching process;

wherein the N type polysilicon gate electrode has an area that is smaller than the area of the first region of the polysilicon layer and the P type polysilicon gate electrode has an area that is smaller than the area of the second region of the polysilicon layer,

wherein the etched area of the non-doped polysilicon dummy gate arrangement has an area that region is larger than the total sum of the etched area of the first region of the occupied by the N type polysilicon gate electrode layer and the etched area of the second region of the P type polysilicon gate electrode layer, and

wherein an end point detection of one of the stages of the etching process is based on the etching of the non-doped polysilicon dummy gate arrangement.

Claim 4 (cancelled).

5. (previously presented) The dry etching method according to claim 3, wherein the two-stage etching includes a first stage using a mixed gas of HBr and O₂ and a second stage using a mixed gas of HBr, O₂ and He.

Claims 6-10 (cancelled).

11. (previously presented) The dry etching method according to claim 3, wherein the N type polysilicon gate electrode and the P type polysilicon gate electrode are disposed adjacent one another.

Claims 12-13 (cancelled).

- 14. (previously presented) The dry etching method of claim 3, wherein the non-doped polysilicon dummy gate arrangement is disposed adjacent to at least one of the N type polysilicon gate electrode and the P type polysilicon gate electrode.
- 15. (currently amended) A dry etching method for a semiconductor device, comprising:

providing a polysilicon layer formed on a semiconductor substrate;

implanting a first region of the polysilicon layer with N type ions and a second region of the polysilicon layer with P type ions, a further region of the polysilicon layer being left as a non-doped region; and

simultaneously etching an N type polysilicon gate electrode from the first region, a P type polysilicon gate electrode from the second region, and a non-doped polysilicon dummy gate arrangement from the non-doped region of the polysilicon layer during a multi-stage etching process,

wherein the N type polysilicon gate electrode has an area that is smaller than the area of the first region of the polysilicon layer and the P type polysilicon gate electrode has an area that is smaller than the area of the second region of the polysilicon layer,

wherein the <u>etched area of the</u> non-doped polysilicon dummy gate arrangement has an area that <u>region</u> is larger than the total <u>sum of the etched</u> area <u>of the first region of the occupied by the N type</u> polysilicon gate electrode <u>layer</u> and the <u>etched area of the second region of the P type</u> polysilicon gate electrode <u>layer</u>, and

wherein the etching process includes at least one etching stage in which end point detection is based on the etching of the non-doped polysilicon dummy gate arrangement.

- 16. (previously presented) The dry etching method according to claim 15, wherein the non-doped polysilicon dummy gate arrangement is disposed adjacent at least one of the P type polysilicon gate electrode and the N type polysilicon gate electrode.
- 17. (previously presented) The dry etching method according to claim 15, wherein the P type polysilicon gate electrode is disposed adjacent to the N type polysilicon gate electrode.
- 18. (previously presented) The dry etching method according to claim 15, wherein the at least one etching stage is conducted using a mixed gas of HBr and O₂.
- 19. (previously presented) The dry etching method according to claim 15, wherein the at least one etching stage is conducted using a mixed gas of HBr, O₂, and He.

. Claims 20-21 (cancelled).
